

Pain, numbness, tingling, or burning in your toes, feet, or legs?

You could be suffering from Small Fiber Peripheral Neuropathy

Small Fiber Peripheral Neuropathy is a condition that affects as many as 20 million American adults¹.

This disorder may be associated with various diseases such as diabetes, B12 deficiency, toxin exposure, or it may occur alone.

If you have similar symptoms, ask your doctor if Epidermal Nerve Fiber Density (ENFD) testing is right for you. This test can provide a definitive diagnosis of small fiber neuropathy and help your physician recommend treatment options.

Treatment and relief are available for most patients with a quick in-office diagnostic test
